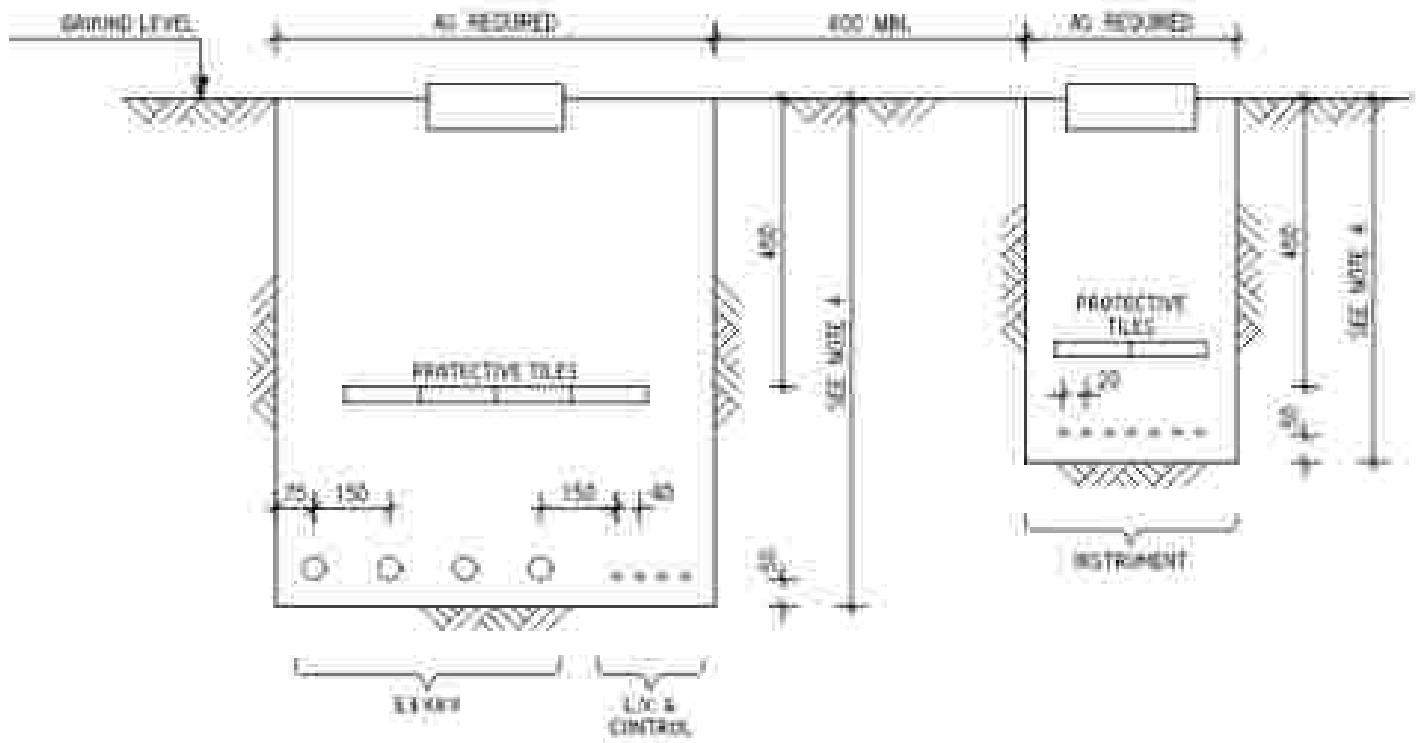
DETAIL OF EARTH TRENCH



CABLE TRENCH SECTION

RELATION OF DIFFERENT TRENCHES SHOWN

ITEM	DESCRIPTION	QTY	REMARKS
1	CABLE MARKER , SEE DWG	AS REQ.	CONTRACTOR SUPPLIED
2	CONCRETE TILE OR BRICK	AS REQ.	
3			
4			

NOTES :

1- ALL DIMENSIONS ARE IN MILLIMETERS UNLESS OTHERWISE STATED.

2- DIMENSION "A" DEPENDS ON NUMBER OF CABLES , MINIMUM TO BE 300 mm.

3- FOR DETAILS OF CONCRETE TRENCHES SEE DWG. K2P-4306R.

4- FOLLOWING MINIMUM CLEARANCES AND DEPTHS SHALL BE ADHERED TO FOR CABLE LAID IN EARTH TRENCHES.

VOLTAGE	MIN. SPACING(B)	MIN DEPTH OF TRENCH(C)	MIN. DEPTH OF CABLE BURIAL
INSTRUMENT CABLES	20	700	650
LOW VOLTAGE & CONTROL CABLES	40	700	650
MEDIUM VOLTAGE CABLES	150	1000	950

5- CABLES LAID DIRECT IN GROUND SHALL BE LAID IN ONE LAYER ONLY. IN CASES WHERE THE CABLES ARE NUMEROUS , SUBJECT TO APPROVAL BY THE ENGINEER , THE CABLES MAY BE LAID IN TWO LAYERS WITH A MIN. VERTICAL SPACING OF 300 mm. THE MINIMUM DEPTH FOR THE TOP LAYER SHALL BE AS GIVEN IN THE TABLE ABOVE.

6- IN TWO LAYER INSTALLATIONS , POWER CABLES SHALL PREFERABLY BE LAID IN LOWER LAYER AND CONTROL CABLES IN UPPER LAYER.

7- WHERE EARTH TRENCHES CROSSING ONE ANOTHER , MINIMUM SEPRATION OF 500 mm SHALL BE MAINTAINED BETWEEN THE NEAREST CROSSING CABLES AND THE ELECTRICAL TRENCH SHALL UNDER PASS THE INSTRUMENT TRENCH.

NOTES

1- FOR STUB-UP OF RIGID PVC AT GRADE REFER TO DWG G-128
2- THE NUMBER OF ELECTRODES TO BE DETERMIND ON SITE DEPENDING ON THE EXPECTED READING OF GROUNDING RESIST.
3- FOR PIPE SUPPORT , REFER TO DWG. No. G-129 .
4- THE LOCATION OF CONNECTION POINTS ARE GENERALLY SHOWN ON THE LAYOUT DRAWING .
5- FOR No. OF GROUNDING POINTS AND WIRE SIZE , REFER TO THE SELECTION CHART IN DWG No. G-130 AND GROUNDING LAYOUT DRAWING .
6- FOR BRANCH CONNECTOR REFER TO DWG. No. G-131 .
7- ALL DIMENSION ARE IN MILLIMETERS .

No.	DESCRIPTION	QTY.
1	CRIMP TYPE TERMINAL LUG , 16 sqmm.	1-EA.
2	BOLT & NUT WITH 1-SPRING , 2-FLAT WASHERS SIZE : M10x35L , FOR EARTH LUG	1- SET
3	ELECTRODE , DRIVING SIDE , 19 mm 1500L	1-EA.
4	ELECTRODE , COUPLING SIDE , 19 mm 1500L	1-EA.
5	COUPLING FOR ELECTRODE	1-EA.
6	EARTH CLAMP FOR SINGLE CONDUCTOR	1-EA.
7	RIGID PVC PIPE 20mm Dia. 300L	1-EA.
8	UNISTRUT CHANNEL (1-4x30x41x2.5)x100L)	1-EA.
9	UNISTRUT CLAMP WITH BOLT/NUT , 20 mm DIA	1- SET
10	MASONRY ANCHOR WITHOUT STUD , M8	1-EA.
11	BOLT WITH 1-SPRING , 1-FLAT WASHER SIZE : M8x60L , FOR MASONRY ANCHOR	1- SET

Type of compensation	☐ Individual ☐ Group	☑ Centralized
Degree of protection	☑ Indoor type ☑ IP 42	☐ Outdoor type ☐ IP 54
Type of cooling	☑ Natural air cooled	☐ Forced air cooled
Outside paint finish color	☑ RAL 7032	☐ by manufacturer
Cubicle / case thickness	2 mm	
Supply voltage	☐ 230 V ±10%	☑ 400 V ±10%
Phase	☐ 1 Ph	☑ 3 Ph
Frequency	☑ 50 Hz	☐ 60 Hz
Wire	☐ 2 Wire	☑ 4 Wire

COMPONENT / ACCESSORIES

Discharge facility	☑ Required	☐ Not Required
Lifting eye	☑ Required	☐ Not Required
Earthing bolt	☑ Required	☐ Not Required
Terminal blocks	☑ Required	☐ Not Required
Power factor control relay	☑ Required	☐ Not Required
Duty / alarm /trip signal status	☑ Required	☐ Not Required

L.E.D indicator	☑ Required	☐ Not Required
Type of Power factor control relay	☑ Automatic	☑ Manual
Number and steps for control unit	☑ By Vendor	
Manufacturer of PF control relay		
Fault detecting relay	☑ Required	☐ Not Required
Power switch / Fuses isolator	☑ Required	☐ Not Required
Meter	☑ Voltmeter ☑ Ammeter	☑ Power factor
Power switch rating		
Fuses isolator rating		
Contactor rating		

CABLE ENTRY

Power circuit	☐ From top	☑ From bottom
Cable size		
Control circuit	☐ From top	☑ From bottom
Cable/wire size	Min. 2.5 mm²

Climate Conditions

Min Temperature	+1°C	Max Temperature	+51°C
Ambient	Dusty (Iron Dust) & Corrosive	Max Humidity	93%
Altitude above Sea Level	6 m		
Location	*indoor*	■*outdoor*	-

Applicable Specifications

Noise Specification	Acc. to IEC, VDE	
Paint Specification	Acc. to Standards	
Paint Finish Color	RAL7038 or RAL7032	
Protection Class	IP54	
Mounting	Rail Mounted On Concrete Pad	
Voltage Variation	±10%	
Frequency Variation	±5%	
TAP Changer	☑ M.V side	☐ L.V side
☑ Off Load	☐ On Load	☐ Automatic
Number of TAPs	5	
Percentage per TAP	2.5%	
Uk	8%	
Parallel Operation with Other Transformer		
☐ YES	☑ NO	☐ For Short Time

Electrical Characteristics :

Type	Oil Immersed With Conservator	
Self Cooled Continuous Output at Ambient Condition	2500 KVA	
Number of Phases / Wires	3/3	
Vector Group	Dyn 5	
Impedance Voltage at Mid. Tap	As Per IEC-60076	
Insulation Class	A	
Cooling Provisions	ONAN	
Winding Conductor Material	Copper	
Primary / Secondary Fault Levels	31.5KA / 50 KA @ 1 Sec	
Surge Protection	☑ Yes	☐ No
Screen between MV&LV Windings	☑ Yes	☐ No
Frequency	50	HZ
Highest Primary Voltage	36	kV
Highest Secondary Voltage	0.6	kV
Rated Primary Voltage	33	kV
Rated Secondary Voltage	0.42	kV
Primary Lightning Impulse Withstand	170	kV
Secondary Short duration Power Frequency Withstand Voltage	3	kV
Method of Neutral Grounding	☐ Isolated	☑ Solid
	☐ Resistor	☐ Resonant (Petersen Coil)
Resistance Value		Ohms
Impedance Value		Ohms
Neutral Current Transformer Ratio	4000/1	A
Neutral Current Transformer Rating		VA
Class	5P20	

Terminations M.V. Side (Primary)

☐ Over Head Lines	☐ BusDuct	☑ Cable
Size of Over Head Lines		mm2
Size of Bus duct (LxW)		mm
Cable Type	NZNSYBY	
Number Of Cable Runs & Size	3(1x500)	mm2
Diameter Over Lead		mm
Diameter Overall		mm
Dry Withstand Voltage		kV
Wet Withstand Voltage		kV
Cable Connection Box	☑ Yes	☐ No

Terminations L.V. Side (Secondary)

☐ Over Head Lines	☑ Bus Duct	☐ Cable
Size of Over Head Lines		mm2
Size of Busduct (LxW)		mm
Cable Type		
Number / Cable Runs & Size		mm2
Diameter Over Lead		mm
Diameter Overall		mm
Neutral Cable Run & Size		mm2
Bus duct Connection Box	☑ Yes	☐ No

Bushings

M.V. Side (Primary)	36	KV
L.V. Side (Secondary)	1	KV

Accessories

Dial Type Thermometer for Oil (1 pcs)	☑ Yes	☐ No
Fan Actuation	☐ Yes	☑ No
Oil Temperature Alarm/ Tripping	☑ Yes	☐ No
Winding Temperature Alarm	☐ Yes	☑ No
Winding Temperature Tripping	☐ Yes	☑ No
Abnormal Pressure Relief Device	☑ Yes	☐ No
Pressure Relief Device Tripping	☑ Yes	☐ No
Pressure Alarm/ Tripping	☐ Yes	☑ No
Buchholz Relay (1 pcs)	☑ Yes	☐ No
Buchholz Alarm	☑ Yes	☐ No
Buchholz Tripping	☑ Yes	☐ No
Oil / Liquid Level Indicator (Magnetic Type)	☑ Yes	☐ No
Level Alarm	☑ Yes	☐ No
Level Trip	☑ Yes	☐ No
Oil Level Sight Glass	☑ Yes	☐ No
Thermometer Pocket	☑ Yes	☐ No
Pressure Indicator	☐ Yes	☑ No

Filling Cap For Topping Liquid	☑ Yes	☐ No
Drain Valve	☑ Yes	☐ No
Oil Sampling Device (On the Bottom)	☑ Yes	☐ No
Filter Connection Valve (2 pcs)	☑ Yes	☐ No
Dehydrating Breather	☑ Yes	☐ No
Vent	☑ Yes	☐ No
Oil For First Filling	☑ Yes	☐ No
Oil Conservator	☑ Yes	☐ No
Earthing Terminals	2	pcs
Wheels	☑ Yes	☐ No
Lifting Lugs	☑ Yes	☐ No
Jack Pad	☑ Yes	☐ No
Instrument Connection Box	☑ Yes	☐ No
Stainless Steel Name Plate	☑ Yes	☐ No
CT For Differential Protection on Neutral	☐ Yes	☑ No
CT For Earth Fault Protection on Neutral	☑ Yes	☐ No
Butterfly Valve to Isolate Radiators	☑ Yes	☐ No
1" Draining Plugs For Radiators	2	pcs
Conservator Cleaning Hole	☑ Yes	☐ No

Tests Required

Refer to transformer specification & acc. to IEC 60076. Routine tests shall be witnessed by purchaser representatives'. Type test certificates should be submitted by manufacturer for similar transformers type, voltage ratio & capacity

MANUFACTURER'S DATA

Manufacturer				
Manufacturer's Type				
Continuous Output At Natural Cooling		KVA		
Continuous Output At Fan Cooling		KVA		
No Load Losses At Un/ 1.1 Un		KW		
Full Load Losses At 75°C And Tap changer In Mid Position	Pf=1		Pf=0.8	
Half Load Losses At 75°C And Tap changer In Mid Position	Pf=1		Pf=0.8	
Efficiency At 75°C And 100% Load	Pf=1		Pf=0.8	
Efficiency At 75°C And 75% Load	Pf=1		Pf=0.8	
Efficiency At 75°C And 50% Load	Pf=1		Pf=0.8	
Max. Inrush Current And Duration		A		Sec
No Load Current At Un / 1.1 Un		/		A
Short Circuit Withstand Current And Duration		A		Sec
Impedance Voltage At 75°C And Tap changer In Mid Position		%		
Filling Oil/Liquid Make And Type				
Temperature Rise Of Oil/Liquid		°C		
Temperature Rise Of Windings		°C		
Insulation Class				
Induced Voltage Test		KV/Hz		
Impulse Test		KV(1.2/50 μs)		
Separate Source Test H.V (Primary)		KV		

Separate Source Test L.V (Secondary)		KV		
Test Carried Out At				
Weight Of Core		Kg		
Weight Of Winding		Kg		
Weight Of Oil		Kg		
Weight Of Extractable Part		Kg		
Total Weight (Filled)		Kg		
Dimensions (HxWxL)		mm		
Distance Wheels / Skids		mm		
Lifting Height Core / Windings		mm		
Screen Between MV & LV Windings				
Busduct Dimensions LxW (If Any)		mm		
Quotation Drawing Number				
Sound Pressure Level At 1 Meter		dB(A)

Contents

1. Scope

This standard covers the minimum requirements for design, testing, rating and supply of low voltage switchgear/MCC up to 1 kV, 3 phases, 4 wires, 50 Hz which will be installed in substations. This standard is supplemented by datasheets, schedule sheets, one line diagrams and interconnection diagrams on which the operating conditions and special requirements will be listed in detail.

In case of conflict between documents listed below, the one appearing first in sequence of this listing will proceed over the following ones.

- Purchase order
- Schedule sheets/datasheets
- All the drawings attached to the requisition
- This material standard
- Other specifications and standards referred to in the above documents.
- Vendor drawings.

Deviations from this standard which the manufacturer may consider advisable shall be submitted in writing to purchaser, together with his quotation, purchaser may approve or reject such deviations. Exceptions other than those included in the above mentioned documents shall not be considered.

Standard designs and models are preferred, provided they meet the requirements of this standard, serve the intended purpose, and can be shown to have at least three years of proven successful service in the field.

All documentation shall be issued, using SI metric system of measurement.

The English language shall be used for all correspondence documents, catalogs, drawings and nameplates. All other languages are not acceptable.

2. Standard and Codes

Design, test and rating of LV switchgear and MCCs shall conform to requirements of the latest editions of the following IEC publications:

IEC-60051	Recommendations for Direct Arcing Indicating Electrical Measuring Instruments and their Accessories.
IEC-60144	Degree of Protection of Enclosures for Low Voltage Switchgear and Control Gear.

IEC-60185/186	Current and Voltage Transformers.
IEC-60255	Electrical Relays.
IEC-60292-1	Low Voltage Motor Starters.
IEC-60439	Factory Built Assemblies of Low Voltage Switchgear and Control gear.

Other relevant IEC publications supplemented by this document, switchboard schedules and single line drawings

Vendor shall state in the quotation standards to which equipment conforms. If these are the national standards, vendor shall state in quotation, deviations if any form the relevant IEC recommendations.

3. Conditions and Regulations

3.1. Conditions of Operation

All of the Electrical Equipment & Systems will be suitable for 24 hours, 7 days/week and 360 days/year operation.

3.2. Site Conditions

The Shadegan Steel Complex is located near the city of Shadegan in Khouzestan province with approximate coordinate of:

Latitude 30°, 32' North

Longitude 48°, 58' East

The region's elevation is about 6 meters above mean sea level (M.S.L.).

The nearest airport is Ahwaz airport.

Max. outdoor ambient temperature	: 51 °C
Min. outdoor ambient temperature	: 1.4 °C
Average maximum air temperature in the summer	: 41-46 °C
Average Relative humidity	: 50 %

4. Design and Construction

4.1. General Requirements

The switchboard/MCC shall be of indoor, metal enclosed type and in accordance with the requirements of IEC publication 60439.

The switchgear and motor control centers shall be of air insulated, multi-tiered type and free standing, self supporting, floor mounting, flush fronted and dead front design with all equipment installed inside vertical steel structures suitably subdivided into arc proof compartment at least for:

- The horizontal busbars
- Incoming feeders
- Bus tie cubicle
- Starters and outgoing feeders.

Each line up of switchgear and MCC shall be suitable and prepared for future extension at either end without any drilling, welding or cutting of the equipment. Unless otherwise noted, MCCs shall be front access type.

The total enclosure shall have the degree of protection IP42 as defined in IEC publication 60144, without using the floor of the switch room as part of the enclosure.

Individual panels of the switchboard /MCC shall be self ventilating.

Thermal rating for all current carrying parts shall be a minimum of 1 second for the rated symmetrical short circuit current, but not less that 150% of that time which is required to clear the faults at the maximum rated symmetrical short circuit level. If the maximum short circuit time must be extended, the I_2t value shall remain constant.

Structural main frames, section frames and forming shall provide strength and rigidity. The switchgear shall be supplied with the base channels and holding down bolts, nuts and washers.

Auxiliary voltages shall be as follows:

Control voltage power center incomers and bus coupler	110 V DC (Battery charger will be supplied by contractor)
Control voltage for Outgoing feeders	110 V AC (from two transformers, one as stand-by, in each MCC)
Space heater voltage	230 V AC

The equipment shall be capable of proper operation for voltage deviations of ±10% and frequency deviations ± 5%. In addition, contactors and relays shall be able to ride through voltage dips of 80% nominal, such as those experienced during motor starting and suitable for maximum fault current of the system.

Unless otherwise noted, the circuit breakers for *I < 630A* can be *MCCB* type and for *I≥630A* should be *ACB* type.

Similar parts shall be interchangeable wherever practicable. Electrically identical components shall be mechanically interchangeable.

Ratings shall not be dependent upon the use of cooling fans.

When the panel has two incomers & one coupling (tie breaker), its operation method should be 2 of 3 breakers.

When the panel has two incomers, (two transformers or one transformer and diesel generator) 4-pole circuit breaker will be considered.

All panel boards shall have necessary spares and 10% space, as shown in SLD.

4.2. Safety and Reliability

Switchgear and motor control centers shall offer a maximum degree of safety under all normal operating and fault conditions. Arc barriers shall be arranged such that the propagation of a possible arc is hindered.

All interlocks shall be mechanical in nature.

All interlocks that prevent potentially dangerous mal-operations must be constructed such that they cannot be defeated easily.

It shall not be possible to open doors of breaker and starter compartments when the breaker or switch is in *ON* position. In *OFF* position, breaker operating mechanism or control circuit shall be lockable.

The switchboard/MCC shall be designed and constructed to facilitate inspection, cleaning, repair and maintenance and to ensure absolute safety during operation, inspection and maintenance.

The assembly shall be suitable for continuous operation at full load for at least 20,000 hr without maintenance which would require the bus bar and dropper system to be de-energized.

4.3. Busbars

Busbars shall be manufactured from hard drawn, high conductivity copper, Silver or Tin coated.

All busbars shall be fully insulated and shall be color coded *Red, Yellow, Blue* and *Black*.

Insulation shall be flame retardant non hygroscopic and rated at *60*°C. It shall be designed for full rated current at maximum ambient temperature specified in requisition, without exceeding their temperature rise limits.

Design of busbars shall be such that future extension of the switchgear to either side is possible.

The main busbars shall be of the same cross sectional area throughout the length of switchboard/MCC.

Bus bars shall be encased in separate compartments within the switchboard/MCC.

All horizontal bus bar joints shall be Tin coated.

A Copper earth bus, rated for the maximum available earth fault current for 1 second, shall run the entire length of the switchgear, with connecting points at each feeder point and at each end of the switchgear.

Unless otherwise noted in data sheet, a neutral bus of at least 50% phase current rating shall extend entire length of switchgear and shall be insulated from phase bus system and also from earth potential.

4.4. Power Circuit Breakers

Air circuit breakers in draw out type design are required. The closing mechanism shall be of stored energy, spring operated type and either manual or motor operated.

Circuit breakers shall conform to IEC publication 60157-1 in terms of rating, testing and performance, to perform the particular duties stated in the switchboard data sheets.

Motor operated breakers shall have provisions for manual emergency operation and slow closing-opening of contacts for inspection and adjustment. Local mechanical off push buttons shall permit tripping of the breaker upon loss of control voltage. Breakers mechanisms shall be mechanically and electrically trip free and have anti pump circuits.

Circuit breaker tripping shall be by means of shunt trip coil and a mechanical trip mechanism.

Each circuit breaker shall be provided with a continuous trip circuit supervision lamp and equipment to indicate trip circuit supply and circuit are healthy.

Facilities shall be provided for testing circuit breakers closing and tripping mechanisms when breaker is in either isolated or withdrawn position.

The breaker disconnect device shall be interlocked with breaker trip shall to prevent withdrawal or insertion of breaker from/into cubicle with breaker in *ON* position. If moving of breaker from, or into the operating position requires undue effort by operator, mechanical aids shall be provided. Automatic shutters shall cover line side primary disconnect contacts automatically upon withdrawal of breaker. The breaker shall be lockable in *DISCONNECT* position.

Breaker control connections shall be via fixed; self aligning disconnects, or via umbilical cord type plugs connections.

As a minimum, *2 N/O + 2N/C* contacts are required, wired to the terminal strip. If additional contacts are required, this will be indicated in the datasheets.

Rated currents of circuit breakers shall be selected from the following IEC standard range: -630-1250-1600-2000-2500-3150-4000 Amperes. Short circuit breaking and making rating current shall be specified on related SLD.

Unless otherwise noted, circuit breakers equal and above 630A should be Air Circuit Breaker type.

All low voltage wiring to and from the circuit breaker shall be terminated on an easily accessible terminal strip within, or close to breaker compartment. Each terminal and each wire shall be clearly identified by the same symbols used in circuit diagrams.

Breakers of identical rating and control scheme shall be completely interchangeable within the same switchgear.

Breakers shall have mechanical indicators for contact positions and spring charging status. It shall also be fitted with indicating lights to show *CLOSED* (red) *TRIPPED* (amber) *OFF* (green) and *TEST* (white) positions.

Maintenance intervals shall be 5 years during normal operation, or after 3 fully rated short circuit interruptions, as per the requirement of IEC 60157-1.

4.5. Motor Control Center Cubicles

MCC cubicles shall preferably have the same height as power switchgear cubicles. Cubicles shall be free standing, self supporting steel structures with isolated arc proof compartments for the following:

- Main horizontal busbars.
- Vertical (dropper) busbars.
- Motor starter or feeder compartments

Cubicles shall be suitable for extension in field without use of cutting, drilling or welding tools.

Unless otherwise specified, fully equipped spare cubicles shall be provided on basis of 20% with minimum of 1 unit, for each different starter size and type. Completion of vertical sections will be by empty cubicles suitably sized where applicable. The empty cubicles shall include connections to bus bar and corresponding support, fixed parts of equipments and doors with holes for mounting instruments and control/indication accessories. The holes shall be blanked off with easily removable plates. Neutral and earthling bus bars shall be as described under power switchgear cubicles.

4.6. Starter and Feeder Modules

Unless otherwise specified, motor starters shall be of direct on line type in accordance with the requirements of IEC 60292-1. Starters shall be draw-out type.

The starters shall include:

- Motor Protection Circuit Breaker (*MPCB*) for motors equal or less than *45kW* and Molded Case Circuit Breaker (*MCCB*) and *Thermal Overload* for motors greater than

45kW. MPCB & MCCBs are mechanically interlocked to compartment door and switch operating handle.

- Electrically operated air contactor.
- Earth fault relay for motors>18.5KW.

Outgoing feeders shall be circuit breakers fitted with protective and indicating devices, with or without shunt trips, as specified in purchaser's data sheets.

Operating handle of main interrupt device shall be door mounted and interlocked with switching device to prevent opening of compartment door when the breaker/switch is in *ON* position. Handles shall clearly indicate *ON* and *OFF* positions of the breaker/switch. For maintenance purposes interlock mechanism shall be able to be defeated by means of a purpose made tool.

Circuit breakers shall be provided with a trip auxiliary contact to open the contactor when an overload trips the circuit breaker.

Control power supply shall be by means of two control power transformers, one as spare, located in each MCC panel. Control voltage shall be *110 VAC*.

Motor *contactors* shall be magnetically operated air break type rated for category *AC3* according to IEC 60158, unless stated in the requisition otherwise.

In addition to load contacts and auxiliary contacts required to operate the starter, a minimum of *1NO + 1NC* auxiliary contacts shall be provided, wired to the terminal strip.

All contactors shall be provided with inherent ambient compensated thermal overload release which shall be adjustable over its full range.

Reset shall be via a door-mounted push-button.

Each starter module shall be equipped with *ON* (red), *OFF* (green) and *FAULT* (amber) pilot light on the door.

All motor starters shall have facilities for remote *START/STOP* of motors.

Starters shall be fitted with a *1A* secondary current transformer for a remote ammeter for motors>4KW.

Starter and feeder modules of identical rating and control scheme shall be fully interchangeable.

Short circuit protection coordination shall be type 2as per IEC.

Stay put type *STOP/RESET* push button accessible from outside of motor starter shall be provided on front of all motor starter doors.

Starters for motors rated above *4kW* shall be provided with one ampere meter and above *18.5kW* with instantaneous ground fault leakage relay (with *core balance* transformer) that will trip the starter on low level ground fault currents.

All components and materials shall be of latest field proven and in current production. Obsolete components or components scheduled for immediate discontinuation shall not be used.

4.7. Protection

Incoming feeders shall be provided with protective relays as indicated on single line drawings which will be attached with the requisition. The following are minimum requirement:

- Over current, adjustable, time delayed (inverse or definite time adjustable)
- Short circuit, fixed or adjustable, short time delayed (adjustable)
- Earth fault (time graded).

Protection relays for power center incoming and bus coupler feeders and motors>150KW shall be multifunction, LCD type, draw-out, flush or semi flush mounted and installed to facilitate ease of maintenance, inspection and testing.

Protective relays and meters shall have provisions for testing and calibrating using an external power supply without disconnecting permanent wiring.

Each incoming feeder shall be fitted with *voltmeter* with selector switch and ammeter with selector switch. Additional metering shall be provided as what will be listed on the datasheets.

4.8. Current Transformers

Rated secondary current shall be preferably *1A* for all switchboard/MCC and remote mounted protective relays and instruments.

Current transformers for *metering* purposes shall be of the accuracy class *0.5*.

Current transformers for *protection* purposes shall be of the accuracy class *5P10* unless otherwise specified in the requisition.

Current transformers shall be capable of carrying, without injurious heating or mechanical damage specified fault current of switchboard for short time rating of cubicle in which are installed.

Vendor shall be responsible for assessing and selecting output rating of current transformers.

Secondary leads of each current transformer shall be connected to test and short circuiting links.

Current transformers shall be installed in stationary part of cubicle. Their secondary terminals shall be accessible from front and shall have shorting facilities.

Test blocks complete with facilities for monitoring shall be foreseen for all protection CT's and PT's.

4.9. Instruments

All indicating instruments shall be flush mounted on front of cubicle and shall be of industrial grade.

Ammeters and voltmeters shall be of the accuracy class 1 and watt-hour meters shall be of the accuracy class 2.5.

Instruments shall be capable of carrying full load continuously without damage or overheating.

Instruments shall not be damaged by the passage of fault currents in the primary of current transformers or voltage variations on the system within the specified system characteristics.

External zero adjustment facilities shall be provided on all ammeters and voltmeters.

4.10. Grounding

All metallic non-current carrying parts of the switchboard/MCC shall be bonded together either by welding or bolting. Main structure shall be grounded via a hard drawn, high conductivity Copper bar, which shall run entire length of switchboard/MCC.

Main ground bar shall be sized to withstand a bolted ground fault for a duration equal to longest short time rating of any item of equipment contained in switchboard/MCC. Minimum size of main ground bar shall be 250 mm^2.

Main ground bar shall be located at rear of switchboard/MCC and shall be accessible from bottom.

Main ground bar shall have provision at each end for connections to the substation main ground grid.

All doors shall be bonded to main structure by means of a flexible Copper connection arranged so that it cannot be trapped as door is closed or opened.

In addition, grounding contacts of withdraw-able items shall make before electrical contacts and break after electrical contacts.

4.11. Internal Wiring and Terminals

All wirings shall be continuous from terminal to terminal with no splicing. Wiring shall be stranded Copper conductor with flame retardant, *600V* insulation.

Minimum conductor size is 4mm^2 for CTs, 2.5 mm^2 for power, 1.5 mm^2 for control and signal wiring.

All wiring shall be marked on each end with permanently embossed wire markers of the heat shrinkable or slip-on type. Wire markers reflecting phase identification shall be provided at the ends of all phase conductors. Wire numbers shall match the vendor's drawings.

Flexible wires shall be used for connection of door mounted equipment to cubicle mounted equipment. This wiring shall be loomed together, wrapped with flexible PVC coil for protection and shall be firmly clamped at both ends to prevent movement at terminations.

Each terminal shall be identified by suitable plastic type numbered ferrules in accordance with the relevant wiring diagrams.

Terminal blocks shall be arranged and positioned to afford easy access for carrying out external cable terminations, testing, inspection and maintenance.

Not more than one wire shall be connected to one terminal. Links shall be provided where more connections are required at one point.

Circuits and terminals operating at different voltage and/or performing different functions shall be adequately segregated or separated by barriers.

The control terminal blocks shall include not less than 15% spare terminals.

4.12. Cable Terminations

The switchboard/MCC shall be complete with the necessary cable termination facilities suitable for the type and size of cables specified in the datasheets and single line drawings.

Terminals for wires 4 mm^2 and above shall be suitable for accepting compression lugs.

Cable entry shall be located to allow sufficient space and access for easy wirings termination of cables and sealing of building entry. Particular attention shall be given to the space and bending radius required for large cables.

Cable supports shall be provided inside the switchboard/MCC for external cable tails, to alleviate undue strain on the cable terminations.

Vendor shall provide compression type cable lugs suitable for the specified type and size of the cables.

All terminal strips shall be treated with anti-fungus varnish.

4.13. Space Heaters

Space heaters to eliminate condensation within the unit shall be mounted in bottom of each vertical section, easily accessible from front. A circuit breaker switch shall be provided for overload protection and a blue light shall be provided on enclosure door to indicate that space heater is in operation. Heaters shall be rated for continuous service and for *230V*, 1 phase *and 50Hz* operation.

Heaters shall be thermostatically controlled with a manual safety *ON/OFF* switch which shall be mounted close by the heater, or on the switchboard.

All heater terminals shall be labeled with a danger notice, or shall be protected or shrouded.

4.14. Assembly

Switchgear shall be completely assembled, wired and tested at the factory and shall be shipped completely assembled if practicable. Where equipment must be disassembled for shipment, material and instructions for reassembling shipping sections including making up main power bus connections at shipping splits shall be provided.

Terminal strips shall be provided for all interconnecting wiring at shipping split and each wire and terminal shall be identified with permanent markers. Detailed wiring diagrams shall be provided to facilitate reconnection of wiring. Necessary bus connections, wire jumpers, bolts, nuts, washers, etc., shall be furnished, suitably packaged and marked to facilitate field assembly. Each shipping container shall be identified as specified in the material requisition and/or purchaser order. Vendor shall indicate his recommendation for onsite storage and handling.

5. Inspections and Tests

5.1. Inspection

During the switchgears/ MCC fabrication process, manufacturer shall provide access to his shops to inspectors so that can verify progress and status of the work being performed.

Inspection shall not relieve manufacturer form his obligations and warranties in accordance with the codes and standards mentioned in this standard.

5.2. Tests

Routine testing of each cubicle shall be performed according to IEC 60157 recommendations or the standards of the country of manufacture.

Routine tests, minimum:

- Power frequency voltage dry test
- Rated voltage test on auxiliary circuits
- Insulation resistance test on auxiliary circuits
- Mechanical operation test
- Function test of auxiliary devices, including relays.

These tests may be witnessed by purchaser. Test certificates are required for each switchboard without additional cost. Purchaser to be notified of these tests at least two weeks prior to tests. Any change in testing schedules shall be communicated immediately to purchaser and confirmed in writing.

Switchgear shall be visually inspected for technical execution and conformity with the approved drawing and the order.

All defects detected as a result of testing shall be repaired by manufacturer at his expense and shall be documented and corrected prior to shipment. If in opinion of purchaser retesting is required after such repairs, this shall also be at expense of manufacturer.

Certified records of the above inspection and tests shall be compiled into one inspection document by the vendor and shall be provided in the quantities and at the times specified in the requisition documents.

Vendor shall provide copies of "type test" certificates to prove design of equipment and components has been successfully tested by a recognized international testing authority at required operating and short circuit duties. Data shall include full details of the "type test" certifications granted to his equipment and shall cover all different items (e.g. circuit breakers, main busbars, down dropper busbars, etc.) Certificates shall be provided for each type and rating of equipment offered.

6. Information Required With Quotation

At least following information shall be submitted with quotation to enable purchaser's engineers for evaluating proposal as to its compliance with enquiry specifications.

- Detailed summary of exceptions of enquiry specification.
- Completed enquiry datasheets.
- Brochures and catalogs containing outline dimensions, main electrical data, and installation details.
- Relay data.
- List of accessories included in bid.
- Tests included.
- Main outline and floor cutout dimensions.
- Shipping weights and sizes.

7. Information Required After Order

7.1. Approval Data

The following information and data shall be submitted to purchaser engineer for approval prior to manufacturing of switchgear and motor control centers:

- Certified outline and floor cutout dimensions, including required clearances for installation, operation and maintenance, and approximate weights.
- Certified drawings of embedded leveling and support steel, if required by the design.
- Certified layout of starter and feeder modules.
- Updated, completed datasheets of purchaser.
- Control schematics and interlock sequences.
- Instrument transformer data, if used.
- Indicating instrument scale values.
- Protective relay types, curves and setting ranges.

7.2. Final Data

At the times and in quantities agreed upon in purchase order, the following shall be submitted:

- Final drawings and documents as listed in clause 7.1.
- Complete schematic circuit diagram of each cubicle.
- Device location drawings.
- Bill of materials for each LV switchgear and MCC, showing complete re-ordering information for all replaceable parts. This information shall coincide with identification found on devices listed.
- Spare parts location, identification and price list.
- Painting specification.
- Installation, operation and maintenance instructions.

Prior to shipment, copies of all routine test certificates shall be made available to purchaser.

All engineering data provided for this equipment shall show equipment as specified and ordered. Typical drawings are not acceptable unless they are revised to show only the equipment being furnished. The format, standards, quality and quantities of drawings shall be manufacturer's standard.

8. Accessories

Accessories shall be furnished together with the switchgear and the MCCs as required for proper and safe operation. As a minimum, the followings are required:

- Manual operating handle for motor operated air circuit breakers;

- Lifting trolley or similar device to remove circuit breakers and large starter module from cubicles;
- Adapter cables for control circuits of withdraw able starter modules.
- Testing cabinet and cable for circuit breakers, if they cannot be tested in withdrawn position in their cubicles;
- Special tools if required for breaker contact maintenance.
- Special tools if required for testing.

9. Installation

Vendors shall note the following:

All incoming and outgoing feeder cables will enter equipment from below via cable gland from trenches or floor cutouts. If bus ducts are specified as incoming feeders, they enter equipment from above.

Foundation bolts and installation instructions shall be provided by vendor.

Proposed layout and elevation plans for the switchgear and MCCs shall be part of vendor's proposal. This drawing shall show recommended clearances for safe operation and maintenance of the equipment.

10. Nameplates

Each circuit breaker and feeder shall be identified with its feeder designation engraved on laminated plastic tags of at least 40x100 mm size. Tag information will be supplied by purchaser. These tags shall be bolted or riveted onto a non removable part of the cubicle. Stick on or glued labels are not acceptable for this purpose. Characters shall be white on a black background.

Each power switchgear cubicle shall have a rating plate with the information required by IEC 60157

Each device installed in the cubicles, each plug assembly and terminal strip, and each indicating and operating element shall be identified with permanently attached plastic tags or labels of approved design. Inscriptions on these tags shall coincide with those used on the drawings.

Each circuit breaker shall have its own rating plate with information according to IEC 60157.

Wording on name-plates, etc., shall be in English.

11. Painting

The equipment shall be painted in accordance with vendor suitable preparation and specification painting cycle.

The painting system shall be suitable for the specified climate condition in the requisition.

Five tins of one liter or paint taken from the same batch as the factory paint shall be included for touching up after installation.

Color of the switchgear shall be RAL7032. (Shall be approved by client before construction)

All panels should be painted by baked color in two/three layer & 120 micron.

12. Spare Parts, Special Tools and Manuals

All special tools and spare parts required for commissioning, startup, and two years operation shall be provided, as well as relevant documents such as drawing, maintenance, operating and installation manuals.

13. Preparation for Shipment

Preparation for shipment shall be in accordance with manufacturer's standards, unless otherwise noted on the request for quotation and/or purchase order. The manufacturer shall be solely responsible for the adequacy of preparation for shipment employed with respect to materials and application, and provide materials to their destination in ex-works condition when handled by commercial carrier systems. All equipment shall be securely fastened to case bottom to avoid displacement during transportation.

All equipment & parts shall be shipped in airtight polyethylene covers and suitably boxed in wooden cases for export shipment. Parts shall have identification tags specifying main equipment, item number and drawing reference.

Additionally silica gel or similar dehydrating compound shall be enclosed in each package.

One complete set of the installation, operation and maintenance instructions shall be packed in the boxes or crates with the equipment. This set in addition to the number of sets specified in the purchaser's requirement for document's forms included in the inquiry/purchase order.

MV Switchgear Specification

Table of Contents **Page**

1. Introduction

1.1 This specification covers the minimum requirements for design, manufacture of AC 33kV switchgear which will be installed in Substations.

1.2 This specification covers only the general requirements of the switchgear and control gear. The specific requirements of each assembly (plan, arrangement, breaker ratings, relaying, metering, one line diagrams, control schemes, etc.) will be shown on detailed Data Sheets and/or drawings which will be part of the Requisition for Quotation and/or purchase order.

2. Standards and Codes

2.1 The medium voltage switchgear shall be designed, manufactured, inspected and tested in accordance with the applicable sections of the latest edition of the following International Electro technical Commission "IEC" standards.

- IEC 60038 IEC Standard Voltages
- IEC 60044-1 Current transformers
- IEC 60186 Voltage transformers
- IEC 62271 High voltage switchgear & control gear
- IEC 60298 AC Metal enclosed switchgear and control gear for rated voltages above 1kV and up to and including 52 kV
- IEC 60529 Degrees of protection provided by enclosures (IP code)

2.2 Where standards other than IEC are specified it is understood that the equivalent IEC standard is acceptable.

2.3 Any deviation from this specification and the above mentioned references shall be clearly mentioned in the vendor's proposal.

2.4 Document Priority

In case of conflict between documents, the order of precedence shall be:

- Single line diagramThe Data Sheets
- This Specification,
- I.E.C standards,

3. Service Conditions

3.1 The switchgear specified herein will generally be installed indoor in substation rooms, which will be ventilated and/or air conditioned.

3.2 Site condition is as follows:

Equipment and materials shall be designed and manufactured for use under the following site conditions:

- Altitude:6m A.S.L.
- Ambient Temperature
  - -Maximum: +51 ℃
  - -Minimum: 1.4 ℃
- Average Relative Humidity 50%
- Design Atmospheric Pressure: 1.01Bar

4. Application

4.1 The operating voltage is 33kV and the highest system voltages according to IEC recommendations.

4.2 The MV switchgear includes circuit breakers with associated control, measuring, protective and regulating devices as specified in this specification and/or indicated in the single line diagram.

5. General Requirements

5.1. Enclosure

5.1.1 The enclosure shall be metal clad type, as defined in IEC 60298 and shall be self supporting, free standing, floor mounted consisting of steel structure/s enclosed by sheet steel with minimum thickness of 2.5 mm. Components shall be accessible from the front of the switchgear.

5.1.2 The indoor enclosure shall provide a degree of protection of IP 42 according to IEC 60529 without using the floor of the switch room as part of the enclosure. The partitions between functional units and shutters for the bus bar side and cable side shall at least provide a degree of protection of IP 41.

5.1.3 The switchgear enclosure shall be self ventilating .Switches, buttons and operating handles shall be installed at a height of not more than 180cm.

5.1.4 The enclosure together with bus bars and wirings shall be extendable at both ends without the need to cut or drill any part of the enclosure.

5.1.5 All incoming and outgoing cable entry to the switchgear shall be from bottom. Gland plates shall be provided in the switchgear assembly for this purpose.

5.1.6 Lifting lugs shall be provided on enclosure/s for ease of handling.

5.1.7 Foundation bolts and installation instructions shall be provided by the vendor.

5.2. Bus bars

5.2.1 Unless otherwise indicated the switchgear shall be with single bus bar and bus bars shall be manufactured from hard drawn, high conductivity copper.

5.2.2 Bus bars shall be designed for the full rated current at the maximum ambient temperature specified without exceeding the temperature rise limits. It shall have the possibility of keeping the symmetrical short circuit level of31.5KA. Design of the bus bars shall be such that future extension of the switchgear to either side will be possible.

5.2.3 Power bus bars shall be fully insulated with flame retardant non-hygroscopic insulation material and shall be color coded. Suitable insulation shall be provided for the bolted joints. The insulation of bus bar joints and connections shall be removable for inspection purposes. Bus bar joints and connections shall be corrosion protected by silver-plating and secured to prevent loosening.

5.2.4 The color or the color coding of the bus bars insulation shall be red, yellow and blue for phase bus bars, from top to bottom and from left to right when facing the front of the switchgear.

5.2.5 The main horizontal bus bars shall be of the same cross sectional area throughout the length of the switchgear. The continuous ampere rating of the main horizontal bus bars shall be indicated in data sheet and/or single line diagram.

5.2.6 Vertical bus bars, if any, shall be of the same cross sectional area throughout their length and their current rating shall be equal to the sum of the maximum full load ratings of the outgoing functional units connected to that bus bar.

5.2.7 The horizontal and vertical bus bars shall be capable of withstanding, without damage, the magnetic forces and the thermal effects created by the maximum specified short circuit current for at least one second . 5.2.8 Main horizontal bus bars shall be in separate compartment. The vertical bus bars shall also be in separate compartment and can be installed behind functional units of each vertical section. The vertical bus bars shall be arranged such that accidental contact with live parts shall be impossible.

5.2.9 An earth bus bar, rated for the maximum available earth fault current shall run the entire length of the switchgear. Adequate provisions shall be fitted to connect the cables screen and/or armor to the earth bus bar. The earth bus bar shall be equipped with suitable connectors or bolts to be connected to earth copper conductors at both ends. The size of the earth bus bar and earth conductors shall conform to IEC 60298.

5.3. Wiring, Terminals and Markings

5.3.1 All internal wiring shall be continuous from terminal to terminal with no splicing.

5.3.2 Wiring shall be stranded copper conductor with flame retardant PVC insulation. Minimum conductor sizes shall be 2.5 mm2 for control and protection, and 1.5 mm2 for signal wiring.

5.3.3 Where wiring is run through a metal sheet or barrier, bushing or other mechanical protection shall be provided.

5.3.4 All internal power cables and wires shall be suitable for the largest continuous current rating of the functional unit and the short circuit current as limited by fuses or circuit breakers.

5.3.5 The sizes of earth wires shall be according to the recommendations of IEC 60298.

5.3.6 Where applicable, flexible wires shall be used for connection of door mounted equipment to the cubicle mounted equipment. Such wiring shall be wrapped with flexible PVC coil or installed in flexible conduit and shall be firmly clamped at both ends to prevent movement at terminations.

5.3.7 Covers and/or doors with electrical apparatus attached to them shall be connected to the switchgear frame via bonding conductors.

5.3.8 All wiring shall be numbered on each end with permanently embossed wire markers of the heat shrinkable type or slip-on ferrules. Wire numbers shall match the manufacturer's interconnection drawings.

5.3.9 All wires shall have cable lugs and shall be terminated in clamp type terminals such that direct contacts between screw, bolt or nut and cable lugs are avoided. For current transformers secondary wiring, ring type cable lugs shall be used.

5.3.10 The terminals shall be identified by suitable permanent numbers in accordance with the relevant wiring diagrams. Terminal marking shall comply with IEC 60445.

5.3.11 Not more than two wires shall be connected to any one terminal. Links shall be provided where more connections are required at one point.

5.3.12 The control terminal blocks shall include 10% spare terminals.

5.3.13 Nameplates shall comply with IEC 60604 and information on the nameplates shall be approved by company representative. Nameplates shall be made of durable corrosion resistant material. The nameplates shall at least contain the following information: Manufacturer's name or trade mark, type designation or serial number, applicable rated values and number of relevant standard.

- Holes for fixing the nameplates shall not influence in any way degree of ingress protection of enclosure.
- Circuit designation on nomenclature to be engraved into the white layer of trifoliate to give black lettering on white background.
- Instruction plates shall be yellow with black inscription.
- Warning or caution plate shall be red with white inscription.

5.3.14 Labels on withdraw able units shall be duplicated on the withdraw able part and the fixed part.

5.3.15 when operation of certain items of the switchgear needs sequential actions such as the release of interlocking features, instruction plates shall be provided near the point of operation.

5.4. Safety Considerations and interlocks

5.4.1 The medium voltage switchgear and control gear shall offer a maximum degree of safety under all normal operating and fault conditions. It must be impossible to unwillingly,

without the use of tools, touch live parts of the switchgear or to perform operations that may lead to arcing faults.

5.4.2 The switchgear assembly shall be suitable for continuous operation at full load for at least 27,000 hrs without maintenance.

5.4.3 Circuit breaker units shall be provided with required safety interlocks in accordance with the functions of such equipment in the overall electrical system and shall conform with the requirements of IEC publication 60298.Interlocks shall be mechanical in nature.

5.4.4 All interlocks that prevent potentially dangerous mal operations must be constructed such that they cannot be easily defeated. If any mechanical interlock is capable of being defeated without the use of tools, provision shall be made for padlocking. The requirements for interlocks and/or padlocking shall be approved by company representative.

5.4.5 When a withdraw able unit has been removed from the switchgear assembly, the live parts inside the fixed compartments shall be protected against touch. Shutters shall be provided to cover the bus bar side and cable side disconnected contacts automatically. The shutters shall be mechanically operated by the movement of the withdraw able units. The shutters for the bus bar side shall be equipped with padlock facilities in their closed position. Earthed metallic shutters are preferred. Shutters shall be colored red for bus bar side and yellow for cable side.

5.4.6 Each functional unit of the switchgear assembly and each section of the bus bars shall have integral facilities for earthing. Earthing arrangement for bus bars can be provided in incomer circuit breaker. The operation of the earthing switch shall be interlocked with the functional unit switching devices so that it can be manually closed only when the relative switching device is not in service position. Padlocking facilities for locking the earthing devices in closed position shall be provided. Earthing method of functional units and bus bar sections shall be approved by company representative prior to manufacturing.

5.4.7 Temperature rise of current-carrying parts shall be limited to the values stipulated in IEC60694 and de rated in accordance with environmental conditions specified in data sheet.

5.4.8 The complete switchgear assembly shall be capable to withstand the thermal and dynamic stresses resulting from short circuit currents. The supplier shall state the short circuit withstand current of the assembly namely bus bars, circuit breakers, at quotation stage.

5.4.9 All the metallic non-current carrying parts of the switchgear including the main structure shall be bonded together and connected to the earth bus bar. Doors shall be bonded to the main structure by means of flexible copper connections.

6. Major Components

6.1. Circuit Breakers

6.1.1 In the medium voltage switchgear, circuit breakers shall be used as incomers to the switchgear, bus couplers, feeders as indicated in the single line diagram.

6.1.2 Circuit breakers shall be withdraw able typefor indoor installations; complete with vacuum interrupters and self aligning disconnecting devices.

6.1.3 The contacts of vacuum interrupters shall be made of proper material such as chrome-copper or equivalent in order to assure low chopping levels of current and produce no harmful over voltages. The circuit breaker actuating mechanism shall be of the spring loading type and the spring shall be charged by a DC motor.

6.1.4 Circuit breakers shall conform to IEC publication 62271-100 in terms of rating, testing and performance and shall be suitable for uninterrupted duty (utilization category B).

6.1.5 Rated currents of circuit breakers shall be selected conforming to IEC recommendations taking into account possible de ratings as per site condition. Incomer circuit breakers shall be sized to feed all the loads indicated in the single line diagram including the spare units.

6.1.6 Circuit breakers shall withstand the r.m.s. symmetrical short circuit for 1 seconds.

6.1.7 Circuit breakers shall be capable of interrupting the specified short circuit current without the aid of replaceable current limiters or fuses.

6.1.9 Tripping of circuit breakers shall be by means of manual mechanical tripping device and dc. shunt trip coil. Electrical and manual closing release shall be provided.

6.1.10 The local manual trip facility of each circuit breaker shall be fitted with a guard to preclude inadvertent operation.

6.1.11 Facilities shall be provided for testing the circuit breaker closing and tripping mechanisms when the breaker is in TEST position.

6.1.12 There shall be three distinct positions for circuit breakers. The draw out mechanism shall hold the breaker rigidly in the three positions of CONNECTED, TEST and DISCONNECTED. The breaker disconnect device shall be interlocked with the breaker trip-shaft to prevent withdrawal or insertion of the breaker from/into the cubicle with the breaker in the ON position.

6.1.13 If moving of the breaker from or into the operating position requires undue effort by the operator, mechanical aids such as handle shall be provided. The breaker shall be lockable in the TSET and DISCONNECTED positions.

6.1.14 Circuit breaker control connections (secondary disconnects) shall be via fixed, self-aligning disconnects, or via flexible cord type plug connection. Either system shall allow test-operation of the breaker in the TEST position.

6.1.15 In addition to auxiliary contacts required for breaker operation, 2 N/O + 2 N/C similar contacts shall be provided and wired to the terminal strip. If additional auxiliary contacts are required, it will be indicated in data sheet.

6.1.16 All low-voltage wiring to and from the circuit breaker shall be terminated on an easily accessible terminal strip within the breaker compartment with label numbering. Each terminal and each wire shall be clearly identified by the same symbols or numbers used in the circuit diagrams.

6.1.17 Circuit breakers of identical rating and control voltage shall be completely interchangeable. It shall not be possible to interchange breakers of different ratings.

6.1.18 Circuit breakers shall have mechanical indicators to show their contact positions status. They shall also be fitted with red and green indicating lights as per IEC 60073 recommendations to show whether the breaker is in closed or open position. In addition, a yellow indicating light shall be provided to show trip on fault condition.

6.1.19 Each circuit breaker shall be provided with a trip circuit supervision system complete with a white indicating lamp to indicate that the trip circuit and trip circuit supply are healthy.

6.1.20 Each circuit breaker shall be equipped with required indicating instruments and protective relays as specified in this standard specification and/or indicated on single line diagrams.

7. Auxiliary Components

7.1. Protective Relays

7.1.1. General requirements

a) The selection of relays shall be in compliance with the requirement of each circuit and in accordance to pertinent section of IEC60255.

b) The number and type of protective relays are stated in single line diagram and data sheets.

c) Relays shall be dust proof flush mounted and of the removable type, provided with calibrating, resetting and testing facilities. Current carrying terminals of the relays shall be automatically short circuited when the relays are withdrawn.

d) Protective relays shall have hand reset facilities and relay operated signals such as flags or other means of indication used on static type relays like Light Emitting Diodes (LED).

e) Indicators (flags or light emitting diodes) shall be visible from the front of the switchgear without the need of opening the relay case or equipment door.

f) Special precautions shall be taken to ensure that relays will not operate accidentally owing to vibrations or shocks e.g. by opening or closing of doors and switching the devices.

g) Elements with multiple functions such as trip and alarm duties shall have separate operating contacts for each function which shall be wired out to separate terminals. Tripping circuits shall always be separated from the other circuits.

h) Relays shall be capable of withstanding the output current of associated current transformers for at least the specified short circuit withstand time of the assembly.

i) The relay test provision shall consist of built in test plugs or switches or separately mounted test terminal blocks.

j) The test provisions shall permit the shorting of any current transformer circuit and for selective disconnection of the relays from current transformers, potential transformers, auxiliary power and circuits controlled by relays.

k) The relay test provisions shall be arranged so that relay cover or compartment door cannot be closed while the relay connections are in the test position.

l) Contacts rating and performance shall be in accordance with IEC 60255.

7.1.2 All relays with the same function shall be interchangeable. The relays shall be such that, the removal of each relay automatically short circuits the relevant current transformer.

7.1.3 Protective relays shall have provision for testing and calibration.

7.1.4 The relaying shall be fail safe such that, failure of any relay does not jeopardize the operation of the electrical system, but alarms the operator.

7.1.5 Relays shall be equipped with clear trip indication, visible to the operator.

7.1.6 Relays shall be manually resettable. In cases where manual resetting of individual relays are not available, a lockout relay with manual reset facilities shall be provided. Non tripping relays, under voltage relays shall be self resetting with indications of operation which shall be hand reset.

7.1.7 Over current relay (OCR)

Over current relays shall be of the inverse definite minimum time (standard inverse , very inverse or extremely inverse) type with high set instantaneous operation and with the following ranges of settings (unless otherwise stated in requisition):

- Current: 50% to 200% of rated nominal current in steps of 5 adjustable.
- Time: Multiplier time characteristics from 0.05 to 1.00.

7.1.8 Earth fault relays

Earth fault protection for consumers shall operate instantaneously.

In other case a range of setting possibilities shall be provided for both current and time.

7.1.9 Under voltage relay (UVR)

The UVR shall be of the automatic reset type, but equipped with a relay operated signal that is maintained until hand reset. The drop out value shall be adjustable between 50% and 65%.The pick up value shall be at least 85% of the system voltage.

The number of operation contacts shall be:

- 3 sets normally open and;
- 1 set normally closed.

This UVR shall operate in combination with a time delayed tripping relay, having a time delay adjustable between 0.2 and 5 s.

7.2. Current Transformers

7.2.1 Current transformers shall be in accordance with IEC 60044-1.

7.2.2 The rated secondary current shall be 1 Ampere for switchgear mounted protective relays and instruments, as well as remote mounted instruments, either directly or via intermediate current transformers. The secondary leads of current transformers for remote mounted instruments shall be short circuited by a removable link at the switchgear factory.

7.2.3 The switchgear manufacturer shall be responsible for assessing and selecting the output rating of the current transformers.

7.2.4 Current transformers for measuring purposes shall be of the accuracy class 0.5.

7.2.5 Current transformers for protection purposes shall be of the accuracy class 5P. The accuracy class of differential protection current transformers shall be class X as defined in IEC60044-1.

7.2.6 The secondary of the current transformers shall be earthed on one side. Where current transformers are connected in Wye, the Wye point shall be earthed. The wiring of the secondary circuits shall have a cross section of 2.5 mm2. Separate earth wire shall be used for measuring and protection current transformers.

7.2.7 The secondary leads of each current transformer shall be accessible and shall be connected to test and short circuiting links.

7.2.8 Current transformers for circuit breakers shall be installed in the stationary part of the relevant cubicle.

7.2.9 Current transformers shall be capable of carrying, without injurious heating or mechanical damage, the specified fault current of the switchgear.

7.2.10 Current transformers shall have appropriate VA rating and saturation factor. The saturation factor shall not be less than 5.

7.2.11 The markings on the current transformers shall be in accordance with the requirements of IEC publications 60044-1.

7.3. Voltage Transformers

7.3.1 Voltage transformers shall be in accordance with IEC 60186, with secondary voltageof 110V between phases.

7.3.2 Voltage transformers shall be protected by current limiting fuses on primary and secondary sides.

7.3.3 One side of the secondary winding of single phase voltage transformers and the star point of three phase voltage transformers shall be earthed through a removable link.

7.3.4 The voltage transformers for measuring purposes shall be of accuracy class 0.5 and for protection purposes shall be class 3P.

7.3.5 Voltage transformers shall be dry Epoxy-Resin or Butyl-Rubber molded type.

7.4. LV compartment

A LV compartment complete with annunciator and with the following requirement may be provided for MV switchgear assembly:

7.4.1 The compartment shall include an open/close push button for each circuit breaker, with synoptic diagrams and associated indication lamps as follows:

- Red - closed
- Green – open
- White - trip circuit healthy
- Amber - auto trip operated

7.5. Anti-condensation Heaters

7.5.1 Anti-condensation heaters will generally be required for all indoor panels. They shall be rated for continuous service and shall operate on single phase voltage of 230Volt, 50Hz.

7.5.2 The numbers and sizes of the heaters, if not shown on drawings, shall be selected by the switchgear supplier.

7.5.3 Heaters shall be energized from 230VAC power provided by the purchaser.

7.5.4 Heater/s shall be protected by a miniature circuit breaker and an earth leakage protection device of 30mA sensitivity.

7.5.5 A contactor/relay in combination with a thermostat shall be provided for the operation of heater/s. An indicating light (preferably blue) shall be provided on the switchgear enclosure to indicate that the relevant space heater/s is in operation.

7.5.6 Heater/s terminals shall be shrouded.

7.6. Accessories

Accessories required for proper and safe operation of the switchgear shall be supplied. At least the following accessories shall be furnished for each assembly or group of assemblies in the same switch room.

a) Device for manually charging the stored energy operating mechanism of circuit breakers.

b) Handle for moving circuit breakers into positions.

c) Fuse pulling device.

d) Lifting trolley or similar device to remove circuit breakers.

e) Special tools for erection and maintenance if applicable.

8. Tests and Inspection

8.1 The equipment under this specification shall be factory tested. Three certified copies of test reports and certificates shall be submitted to the purchaser.

8.2 Purchaser will require the presence of his nominated representative to witness the final factory tests. The supplier shall inform the date of such tests at least four weeks in advance.

8.3 The purchaser's inspectors shall be granted the right for inspection at any stage of manufacture and testing.

9. Spare Parts

9.1 Together with the supply of all equipment under this specification, a complete set of spare parts for commissioning shall be supplied for each switchgear .The supplied spare parts shall comply with the same specifications as the original parts and shall be fully interchangeable with the original parts without any modification.

9.2 The vendor shall also supply a list of recommended spare parts for two years of operation.

10. Documentation

10.1 The vendor shall supply the necessary information with the quotation to enable evaluation of the submitted proposal. General documents/drawings are not acceptable unless they are

revised to show the equipment proposed. The documents to be supplied with the quotation shall at least include the following:

a) Completed enquiry data sheet/s.

b) Summary of exceptions/deviations to this standard specification.

c) Brochures and catalogues containing description of typical switchgear and technical data on major and auxiliary components such as circuit breakers, contactors, relays, meters etc.

d) List of accessories included in the bid.

e) Preliminary dimensional drawings.

f) Approximate shipping weights and sizes.

10.2 The documents which shall be supplied together with the equipment shall at least include the following:

a) Updated and completed enquiry data sheet/s.

b) Final single line diagram/s.

c) Schematic control circuit diagrams of each kind of circuit breaker.

d) General arrangement drawings showing main dimensions, panels' layout, floor panel and shipping sections.

e) Drawing/s showing the location of field wiring terminal strips and power cable connections.

f) Information concerning interlock sequences.

g) List of major and auxiliary components, showing complete reordering information for all replaceable parts.

h) Recommended spare parts list for two years of operation.

i) Test reports and performance curves of the final routine tests.

j) Painting specification and test result/s.

k) Applicable test certificates.

l) Installation, operation and maintenance instruction/s.

m) Fault finding and troubleshooting manual/s.

n) Protective relay/s types, curves and setting ranges.

o) Cut-off current characteristics of fuses.

p) Total weight of the assembly and of the individual shipping sections.

q) List of accessories and/or any special tools required for erection, operation and maintenance.

11. Shipment

11.1 The supplier of the equipment under this specification is the sole responsible for packaging and preparation for shipment.

11.2 The packaging in wooden box and preparation for shipment shall be adequate to avoid mechanical damage during transport and handling.

11.3 Each shipping section shall be provided with permanently attached identification tag containing necessary information together with the switchgear identification number as indicated in data sheet.

11.4 Shipping documents with exact description of equipment for custom release shall be supplied, with the equipment.

12. Guarantee

12.1 The supplier of the equipment under this specification shall guarantee the equipment and shall replace any damaged equipment/parts resulting from poor workmanship and / or faulty design.

12.2 The supplier shall replace any equipment failed under the following condition:

- Failure under startup and commissioning tests performed according to IEC recommendations.

Failure under normal usage for a period of 12 months, not exceeding 18 months from the date of dispatch from the manufacturers works.
